

A MONO ~

MATERIAL

DESIGN

GUIDE

What added value does my product bring? Is there a tangible benefit for the user and/or does it represent something I can identify with and want to preserve?

**Functional
clothing with
a lower rate
of wear and
tear**

→ Focus on durability &
repairability

**Everyday
clothing with
a higher rate
of wear and
tear**

→ Focus on recyclability

What criteria should my product meet?

- ☐ Waterproof
- ☐ Water repellent
- ☐ Windproof
- ☐ Breathable
- ☐ Light-weight
- ☐ Abrasion resistant
- ☐ Insulation
- ☐ Fast drying

→ There is no **SUPER** material that fulfills all criteria equally
→ Balance of priorities

Recycled material tends to be less durable than virgin material, but it has a higher resource efficiency.

Important to note: recycled material carries a higher potential for releasing microplastics.

Branding & logo

- Use heat press or embroidery
- Create a unique design language that eliminates the need for excessive branding

Trim size

- Trims in mono-material are not as durable as conventional trims, size up to ensure durability
- Use 5 mm zipper minimum or bigger

Zipper

- **Waterproof zippers in mono-material are not yet available**
- **Make a flap or pleat over the zipper**

Pleats

- Question the necessity of zippers and other trims
- Opt for pleats as an alternative

No elastics

- Use cords and mechanical stretch
- Find alternative solutions

Colors

- Avoid colorblocks within the main fabric of the garment
- Use monochrome colorways

Longevity

- Reinforce heavily stressed areas
- Robust and stitched seams can be repaired more easily

Care labels

- Create care labels using the same material as the main fabric
- Provide a digital product pass

Packaging

- Use Mono-material packaging, avoid material blends
- Can the packaging be integrated into the product or serve any other purposes?

Reduce fabric consumption

- Use 3D software to save time & resources
- Make straight cut lines & reduce pattern pieces
- Balance between workmanship and efficiency

Avoid tension points

- Tension points where multiple seams intersect tend to tear
- Water can penetrate more easily

Textile Recycling

- How is the textile reintegrated into a circular recycling loop?
- Initiatives for take-back logistics
- Create incentives for customers

Transparency

→ Use technology to educate the consumer about product features (such as product care, choice of materials, etc.)
